

Septic Tank Treatment

Understanding your Septic System

If you are like most people, you know very little about your septic system. This is understandable. In urban and suburban areas there are sewers to carry household waste to municipal wastewater treatment plants. In more rural areas, however, septic tank systems provide the functions of both sewers and treatment plants. *Webster's Dictionary* defines the septic tank as "a tank in which waste matter is decomposed through bacterial action".

If you could look inside your septic tank, you would find three layers. The top layer is the "Scum" layer where organic material floats to the surface. Bacteria in the septic tank biologically convert this material to a liquid. The middle layer is the "Effluent" layer where mostly clear water will be found. This clear water is the only layer that should enter your absorption area. The bottom layer is the "Sludge" layer. This layer is where the inorganic or inert solid materials and the by-products of bacterial digestion sink to.

All household waste is disposed of through the septic system. The proper operation of the septic is essential to health, property value, and the ecology. A small commitment to the care of your septic system will protect you from the nightmare created by a failing system.

Specifications

Form: Free-flowing granular powder
Color: Tan (may be dyed blue)
Nutrient Content: Biological nutrients & stimulants
Plate Count: 300 billion per 2 oz pouch

Packaging

2 ounce water soluble pouches, 12 pouches per box

Storage

DO NOT FREEZE! Store in a cool dry location. Do not inhale dusts, avoid excessive skin contact. SEE M.S.D.S.

Application Instructions

Septic Tanks

Tank Size

1-1,500
gallon cap.
1,500-3,000
gallon cap.

Maintenance**

1 pouch
per month
2 pouches
per month

** Add as regularly as possible.

Septic Cleaning - Installations & Repair

Vacuum Pumping

Radio Dispatched

7 Day - 24 Hour Service

- Municipal

- Residential

- Commercial
